

WHAT IS ANKYLOSING SPONDYLITIS

Bamboo spine is a radiographic feature seen in ankylosing spondylitis that occurs as a result of vertebral body fusion by marginal syndesmophytes. Together these give the impression of undulating continuous lateral spinal borders on AP spinal radiographs and resemble a bamboo stem; hence the term bamboo spine.

REASONS OF ANKYLOSING SPONDYLITIS

Ankylosing spondylitis has no known specific cause, though genetic factors seem to be involved. In particular, people who have a gene called HLA-B27 are at greatly increased risk of developing ankylosing spondylitis. However, only some people with the gene develop the condition.

SYMPTOMS OF ANKYLOSING SPONDYLITIS

Early signs and symptoms of ankylosing spondylitis might include pain and stiffness in your lower back and hips, especially in the morning and after periods of inactivity. Neck pain and fatigue also are common. Over time, symptoms might worsen, improve or stop at irregular intervals.

NEUROTHERAPY TREATMENT

First day	A-Heparin (6) Adr
Second day	Normal treatment formula
Third day	Genes treatment formula
Fourth day	Normal treatment formula
Fifth day	Acid treatment formula (6) Adr
Seventh day	Left side treatment formula
