

## WHAT IS PSORIASIS?

Psoriasis is a skin disorder that causes skin cells to multiply up to 10 times faster than normal. This makes the skin build up into bumpy red patches covered with white scales. They can grow anywhere, but most appear on the scalp, elbows, knees, and lower back.

## TYPES OF PSORIASIS

There are five official types of psoriasis:

- Plaque.
- Guttate.
- Inverse.
- Pustular.
- Erythrodermic.
- Psoriatic arthritis.

## REASON OF PSORIASIS

While the exact cause of psoriasis isn't fully understood, scientists believe psoriasis is the result of several factors, including the immune system. When you have psoriasis, your immune system is overactive. This creates inflammation inside the body, which is a cause of the symptoms you see on the skin.

## SYMPTOMS OF PLAQUE PSORIASIS

- Red, raised, inflamed patches of skin.
- Whitish-silver scales or plaques on the red patches.
- Dry skin that may crack and bleed.
- Soreness around patches.
- Itching and burning sensations around patches.
- Thick, pitted nails.
- Painful, swollen joints
