

WHAT IS BOILS

A boil is a skin infection that starts in a hair follicle or oil gland. At first, the skin turns red in the area of the infection, and a tender lump develops. After four to seven days, the lump starts turning white as pus collects under the skin.

TYPES OF BOILS

- Carbuncle.
- Hidradenitis suppurativa (seen in the armpit or groin)
- Pilonidal cyst (area on the back where the buttocks merge)
- Cystic acne.
- Sty (Stye)

CAUSES OF BOILS

Most boils are caused by a germ (staphylococcal bacteria). This germ enters the body through tiny nicks or cuts in the skin or can travel down the hair to the follicle. These health problems make people more susceptible to skin infections: Diabetes.

SYMPTOMS OF BOILS

- The skin around the boil becomes infected. It turns red, painful, warm, and swollen.
- More boils may appear around the original one.
- A fever may develop.
- Lymph nodes may become swollen.

NEUROTHERAPY TREATMENT

First day	Virus treatment formula	
Second day	(8)	Th + Ch
	(4)	Thyroid
