

## **WHAT IS BOW LEGS?**

Bowlegs is a condition in which a person's legs appear bowed out, meaning their knees stay wide apart even when their ankles are together. ... You should contact a doctor if your child has bowlegs beyond the age of 2. Bowlegs is also known as congenital genu varum.

## **TYPES OF BOW LEGS**

The affected bone curves in or out and forms the usual "archers bow" which can also be called bow-legs. There are two types of Blount's disease. The first type is Infantile: this means that children under four are diagnosed with this disease.

## **REASONS OF BOW LEGS**

Bowlegs that do not straighten as your child begins to walk may be caused by more serious problems such as: Rickets, a bone growth problem caused by lack of vitamin D or calcium. Blount's disease, a bone growth disorder in the shinbone (tibia) Abnormal bone development.

## **SYMPTOMS OF BOW LEGS**

- Bowed legs that continue or worsen after age 3.
- Knees that do not touch when the child is standing with feet and ankles touching.
- Similar bowing in both legs (symmetrical)
- Reduced range of motion in hips.
- Knee or hip pain that is not caused by an injury.
