

WHAT IS TILT (LEFT SIDED)?

This means the neck muscles on your baby's left side may be tight, and the neck muscles on the right side are weak. Your baby prefers to look to the right, and her head may be tilted to the left. ... Your baby's right neck muscle isn't strong enough to pull her head to the middle (or neutral) position.

REASONS OF TILT (LEFT SIDED)

Most cases of head tilt are associated with a condition called torticollis (described below), although in rare instances a head tilt can be due to other causes such as hearing loss, misalignment of the eyes, reflux (a flowing back of stomach acid), a throat or lymph node infection, or, very uncommonly, a brain tumor.

SYMPTOMS OF ACQUIRED TORTICOLLIS ARE:

- Head tilts to one side.
- Limited range of motion in the head and neck.
- Recurrent episodes of head tilting. During these episodes, your child may also experience drowsiness, irritability, or vomiting.
