

WHAT IS LOW URINE OUTPUT?

Oliguria is the medical term for a decreased output of urine. Oliguria is considered to be a urinary output of less than 400 milliliters, which is less than about 13.5 ounces, over the course of 24 hours. The absence of urine is known as anuria.

CAUSES OF LOW URINE OUTPUT

Common causes of decreased urine output include: Dehydration due to vomiting, diarrhoea or fever, and a simultaneous lack of adequate fluid intake. Total urinary tract obstruction, such as may result from an enlarged prostate.

SYMPTOMS OF LOW URINE OUTPUT

- Dehydration due to vomiting, diarrhoea or fever, and a simultaneous lack of adequate fluid intake.
- Total urinary tract obstruction, such as may result from an enlarged prostate.
- Severe infection leading to shock.
- Kidney inflammation or damage.

NEUROTHERAPY TREATMENT

P – Heparin
S4 – S5

If decrease is due to fever, then give.
